2. Graph of performance vs. number of threads with the colored curves being NUMCAPITALS

3. Graph of performance vs. number of capital cities with the colored curves being NUMT

4. Commentary

1. Tell what machine you ran this on: -

Flip

Linux flip2.engr.oregonstate.edu 5.14.0-503.33.1.el9_5.x86_64 #1 SMP

PREEMPT_DYNAMIC Wed Mar 19 16:23:31 UTC 2025 x86_64 x86_64 x86_64

GNU/Linux

2. Tell what operating system you were using: -

Linux

3. Tell what compiler you used: -

g++ (GCC) 11.5.0 20240719 (Red Hat 11.5.0-5)

4. Tell us what you discovered by doing this. What patterns are you seeing in the graphs?

As I experimented with different numbers of threads and capital cities, I found that parallel computing does help speed things up but only to a point. Using more threads generally improved the performance at first, but after 4 threads, I noticed the improvements weren't as strong. Surprisingly, 4 threads gave the fastest results in many cases.

This made me realize that sometimes having too many threads can backfire. When there are more threads than the system can handle smoothly, they might end up waiting on each other or using shared resources inefficiently. It was interesting to see that the best performance came not from the maximum number of threads, but from a setup where the workload was well balanced and didn't overload the system.

5. Extra Credit: print the list of the final capital cities

2 capitals
